

ABSTRACT OF THE DISCLOSURE

A cleaning device including a handle and a pan is provided. The pan has a smooth, continuous inner surface which facilitates cleaning. A ramp portion of a base of the pan has a transitional angle of inclination which facilitates pulling waste into the pan. Spacers and supports are provided to ensure that the front ramp remains in contact with a surface when a downward force is applied to the pan. A method is also provided which, using the aforementioned cleaning device, reduces the time necessary to remove a hazard on a surface.
